# HTML - Phrase Tags

The phrase tags have been designed for specific purposes, though they are displayed in a similar way as other basic tags like <b>, <i>, , and <tt>, you have seen in previous chapter. This chapter will take you through all the important phrase tags, so let's start seeing them one by one.

### **Emphasized Text**

Anything that appears within <em>...</em> element is displayed as emphasized text.

#### **Marked Text**

Anything that appears with-in <mark>...</mark> element, is displayed as marked with yellow ink.

### Strong Text

Anything that appears within <strong>...</strong> element is displayed as important text.

### **Text Abbreviation**

You can abbreviate a text by putting it inside opening <abbr> and closing </abbr> tags. If present, the title attribute must contain this full description and nothing else.

```
My best friend's name is <abbr title = "Abhishek">Abhy</abbr>.
</body>
</html>
```

## Acronym Element

The <acronym> element allows you to indicate that the text between <acronym> and </acronym> tags is an acronym.

At present, the major browsers do not change the appearance of the content of the <acronym> element.

#### **Text Direction**

The <bdo>...</bdo> element stands for Bi-Directional Override and it is used to override the current text direction.

## **Special Terms**

The <dfn>...</dfn> element (or HTML Definition Element) allows you to specify that you are introducing a special term. It's usage is similar to italic words in the midst of a paragraph.

Typically, you would use the <dfn> element the first time you introduce a key term. Most recent browsers render the content of a <dfn> element in an italic font.

## **Quoting Text**

When you want to quote a passage from another source, you should put it in between <br/> <blockquote>...</blockquote> tags.

Text inside a <blockquote> element is usually indented from the left and right edges of the surrounding text, and sometimes uses an italicized font.

```
<!DOCTYPE html> <html>
```

#### **Short Quotations**

The <q>...</q> element is used when you want to add a double quote within a sentence.

#### **Text Citations**

If you are quoting a text, you can indicate the source placing it between an opening <cite> tag and closing </cite> tag

As you would expect in a print publication, the content of the <cite> element is rendered in italicized text by default.

### Computer Code

Any programming code to appear on a Web page should be placed inside <code>...</code> tags. Usually the content of the <code> element is presented in a monospaced font, just like the code in most programming books.

## **Keyboard Text**

When you are talking about computers, if you want to tell a reader to enter some text, you can use the <kbd>...</kbd> element to indicate what should be typed in, as in this example.

## **Programming Variables**

This element is usually used in conjunction with the and <code> elements to indicate that the content of that element is a variable.

## **Program Output**

The <samp>...</samp> element indicates sample output from a program, and script etc. Again, it is mainly used when documenting programming or coding concepts.

#### **Address Text**

The <address>...</address> element is used to contain any address.
